Mind Map

Object Detection

- Create a scoring function by multiplying our depth map by our color mask
- High enough scores are tagged as objects
- Tag all objects with their associated color
- An object found above a y-axis threshold is the sample color
- Transform pixel values to physical location

Navigation

- Using ROS navigation package
- Load predefined map with april tags
- Define waypoints with respect to april tags
- ROS SLAM implementation handles obstacle avoidance and path finding
- Waypoints queued by task planner

Thank you
